Re: Proposed topics for in-class presentation (1813 Section #)

This memo proposes two possible topics for the final inspection report and briefly outlines why they are appropriate for the assignment.

The first proposed topic is Wireshark. Wireshark is an open source network protocol analyser used in the computer systems technician program at Algonquin College. Network analysers are programs that visualize network functions and allow technicians to monitor, manage and troubleshoot a specific network. These analysers are essential for any CST and would be a good tool to inspect.

The second topic is a LYNKSYS WRT1900AC AC1900 Dual-band Wi-Fi Router. This router is considered one of the best dual-band wi-fi router on the market today [1]. There are many different features to test on this device, so it would be easy to create relevant criteria.

I believe these technologies are important and relevant to the CST program and would make excellent subjects for the final inspection report. If you have any questions about these proposed technologies, please contact me at the following email: ?????@algonquinlive.com.
